Reversal symmetrical triangles require five contact points under classical principles. The 5th point in Silver is not well formed. A quick retracement back toward 1740 would have been better.

2 20

FactorMembers @factor_members · 6h

Gold and Silver both have arguably broken out to upside. Factor Tracking is now long both markets.

1 17

FactorMembers @factor_members · 6h

Diamonds are almost always tops. I do not recall ever trading a diamond bottom. If you want to know what a clean diamond looks like, here is one. Not expanding sym tri followed by regular sym tri

FactorMembers @factor_members · 5h

An estimated 80%-plus of what I trade each week is dictated by the heavy lifting I do the previous Friday. I am currently in the heavy lifting period.

My conclusion on US equities is this:
 We are stuck in a prolonged trading range.
 We will need huge slugs of volume to break free
 Should a 90%-up volume and new highs occur on a WBB up, one has to be long something.

Here is a frightening thought:
 What if pattern in Euribor becomes a half-mast triangle?
 This would produce NIRP of at least -65 BPs in EU.

Euribor 3 mo

Criteria for a double bottom.

1. Bottoms at least several months apart - check
2. Height of pattern at least 20% of underlying value - check
3. Decisive close above mid-point high - way too early

My trading week in brief
 Friday -- chart scroll, select markets for coming week
 Sunday -- Master order template for coming week, start entering orders
 Mon-Thurs -- implementation

1 10

FactorMembers @factor_members · 2h

As a general rule I double the target of a tight and narrow (5-10% of underlying value) horizontal rectangle or ascending triangle. \$MSFT has not yet broken out, but asc tri is biased toward upside.

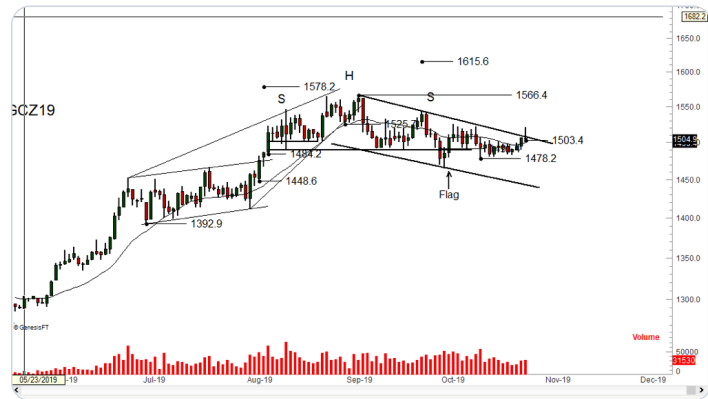

6

FactorMembers @factor_members · 1h

The 1503.4 pivot (today's low) is now my defense level for Dec Gold. This is great example of why I advise against chasing breakouts.
