If **\$BTC** breaks 40,000 (and completes a possible right angled broadening triangle) a decline to test the underlying parabolic curve would be my next level of support

**FactorMembers** @factor\_members · Jan 22

Here you go. Keep in mind that my rules get tweaked from time to time

Hi Peter. Do you have a list of some of these other rules you look at? Or are you able to reference some books/documents that could be of interest? Would be greatly appreciated. Thanks.

Head shot doji today in NASDAQ.  
Under my trading rules, an alternative interpretation of the 3DTSR can consider today as both the high and set up days. \$NQ\_F

David

A trade that turns into a loser quickly is an easy trade to manage

A trade that shoots straight to the target is an easy trade to manage

THE HARDEST TRADES TO MANAGE ARE THOSE THAT ARE INBETWEEN  
LOSS AND TARGET

It seems as if whatever decision is made will be the wrong decision

My rules are not water-tight on "in-between" trades -- in many ways I  
wish I was systematic. 32.2 is an enormous risk given where we are

This is where I always fail to capture large moves, am too guarded and put both  
tranches on the 3DTSL. I'm thinking here I'll keep 1 tranche under the 32,200  
pivot and then use any subsequent pivot lows as protection. Any advice from  
FMs would be appreciated on breathing space
